

Consistently Clean Residue

Row unit-mounted row cleaners hurt row unit ride and affect down force requirements. Reveal is frame mounted, removing its impact on the row unit. With its own internal gauge wheel, Reveal precisely controls the depth of the cleaning tines to create a consistently clean and ideal seeding environment for even emergence to occur.

Keeping residue out of the seed trench is imperative to get consistent germination and emergence. In order to do this, it takes a row cleaner that can remove the surface residue and not impact the operation of the row unit. Traditional row cleaners can tend to bounce across the soil surface, causing them to miss some residue that can end up in the seed trench. This bouncing also causes row unit bounce that negatively effects the row unit.

Eliminate Row Unit Impact

Reveal is mounted on the frame of the planter, eliminating any negative effect on the row unit. Reveal is unique in that it uses an internal gauge wheel to determine the depth of the tines as opposed to being gauged outside of the cleaning tines. Reveal also allows the depth of the tines to be adjusted independent of the pressure being applied to the row cleaner. This allows the operator to set a pressure that keeps the internal gauge wheel in contact with the ground, and then adjust the depth of the tines to do the best job cleaning.

With Reveal on your planter, you can clean residue, not impact your row unit, and do it easily.

Reveal™

Row unit-mounted row cleaners hurt row unit ride and affect down force requirements. Reveal is frame mounted, removing its impact on the row unit. With its own internal gauge wheel, Reveal precisely controls the depth of the cleaning tines to create a consistently clean and ideal seeding environment for even emergence to occur.
